

MOHIT BHANDARI

Dehradun, Uttarakhand, India

☎ 9548352358 ✉ mohitbhandari852@gmail.com [in LinkedIn](#) [Github](#) [LeetCode](#)

Education

Uttaranchal University

Bachelor of Technology in Computer Science, CGPA: 9.1

Sept 2022 – Aug 2026

Dehradun, Uttarakhand

Experience

Acorn Globus

February 2025 – July 2025

Software Engineer Internship

Remote

- Built an **automated abandonment recovery system** that securely dispatches continuation links to users who drop off mid-way, improving overall form completion rates.
- Integrated an **AI-powered form generation engine** into Formester with multi-tier rate limiting (2 req/min, 5/hour, 10/day), enabling zero-login live previews while controlling costs and preventing abuse.
- Created **dynamic state-validation logic** so form fields conditionally render in real-time based on a user's email verification status.
- Designed a **dynamic embed configurator** that gives clients full control over iframe injection parameters, including dimensions, hex themes, and typography.

W3 Dev

August 2024 – September 2024

JavaScript Development Intern

Dehradun, Uttarakhand

- Refined the AI chatbot's **prompt generation logic** to produce more accurate, relevant, and coherent responses.
- Added **export-to-PDF** functionality and chart/graph visualizations for clearer data representation inside the chatbot.
- Developed a complete **chat history system** that lets users access and continue previous conversations.

Projects

Reeling [🔗](#) | [🔗](#)

2026

- Architected a stateless, horizontally scalable **Go API layer** that handles concurrent transcode jobs using **NATS JetStream** as a durable message broker, decoupling upload ingestion from CPU-intensive workloads.
- Built an asynchronous worker pool around **FFmpeg** that supports high-concurrency multi-rendition stream generation (HLS) with minimal latency.
- Used **PostgreSQL** for transactional job state and **AWS S3 / MinIO** for scalable delivery, preserving 100% data consistency even when workers crash.
- Tools:** Go, FFmpeg, PostgreSQL, NATS JetStream, AWS S3, Docker, REST API

Koder [🔗](#) | [🔗](#)

Jun 2025 – Jul 2025

- Developed a full-stack coding platform featuring a browser-based multi-language editor (Monaco), problem library, submission tracking, and personalized user dashboard.
- Added secure authentication (Google/GitHub OAuth, JWT + refresh tokens, email OTP verification/password reset) and asynchronous email processing with **BullMQ**.
- Designed a **Redis** caching layer and optimized **MongoDB** aggregation pipelines for dashboard analytics (progress, language & skill stats), cutting query time by 60% under high concurrency.
- Tools:** Next.js, TypeScript, Node.js, Express.js, MongoDB, Redis, BullMQ, Docker

Technical Skills

Languages: Go, TypeScript, Python, Java, JavaScript

Backend / APIs: Node.js, Express.js, REST APIs, gRPC, Socket.IO

Databases & Queues: PostgreSQL, Redis, MongoDB, NATS JetStream, BullMQ

Cloud / DevOps: Docker, AWS S3, MinIO, GitHub Actions CI/CD, Git, Linux

Architecture / Tools: Microservices, System Design, FFmpeg

Achievements & Open Source [🔗](#)

- LeetCode:** 650+ problems solved | Contest Rating 1660+ (Top ~16%)
- Open Source:** 2+ PRs merged into Open Source
- OpenStatus** – Refactored timeline chart aggregation from $O(n \cdot t)$ nested filters to $O(n)$ mathematical spatial indexing, enabling dynamic log levels and significantly lower latency on large datasets. [🔗](#)
- OpenStatus** – Eliminated redundant metadata computation (charts, facets, percentiles) on infinite-scroll pagination, cutting server CPU and network payload on subsequent page fetches. [🔗](#)
